

NUK AUSTRALIA JUNE 2011 –STATEMENT

NUK and BPA

At NUK, we are proud of the trust that has been placed in us by mothers and fathers in over 100 countries for more than 50 years. Working together with experts from medicine and science to promote the healthy development of babies worldwide, NUK, as you would expect, keeps up with innovations and changes within the industry.

NUK products are developed in Germany after extensive research and development, and all the products adhere to the strictest quality control along with current European and Australian standards. Each NUK product is endorsed with a NUK certification of quality, which gives you the assurance that NUK is there to help make parenthood the most enjoyable time.

We have been very aware of the extensive research carried out over a number of years concerning the presence of BPA in polycarbonate food containers (including babies' bottles). We are convinced that the safe release levels established by the European Food Safety Authority (EFSA) are appropriate to ensure the safety of all users of these products

At NUK we understand parents' concerns, along with our aim of always giving parents a feeling of safety and the best for their baby. Accordingly, we switched our production of NUK baby bottles to BPA-free materials months ago and can guarantee that we make absolutely no use of materials containing BPA in the manufacture of baby bottles at our production sites.

NUK has award-winning, high-quality products and has many years of experience producing baby bottles and other NUK products in alternative materials such as glass or polypropylene (PP). To help you easily identify NUK's BPA-free baby bottles and other NUK BPA-free products, we have clearly marked them with the sign "BPA-free".

To give another level of reassurance, independent institutes also carry out repeated safety checks on all NUK products as a matter of course.

Trust and enjoy NUK – and feel safe. Because we care.
